

Without the `--extra_mark_envs` option specified, `corrinline` could not run successfully on this file.

So if we have an ~~`**ERROR**`~~ in this document, and we annotate it in the PDF, we won't be able to do anything because no ~~tex~~ boxes will be created by the program since all the text is inside an environment which was not specified for marking.

~~Most of the time this isn't an issue because~~ the most frequently used environments which are safe to mark in are already ~~compiled~~ by the program.

Ideally you should never need to use this option, but if for some reason, even after cleanup, there remains peculiar environments which you know can be marked but are not standard, you can add them ~~to this option like~~

```
corrinline annotated_file.pdf latex_file.tex --extra-marked-envs=test,dummy
```

You can also do

```
corrinline annotated_file.pdf latex_file.tex --extra-marked-envs="test,dummy"
```
